Todo Expo Frontend

This is the frontend application for the Todo Expo app built with Expo and React Native.

Application Logo

The application logo displayed after installing the Android APK is configured in the app.json file.

The logo images are stored in the assets folder.

- The main app icon is set via the icon field in app.json.

- The Android adaptive icon is set via the android.adaptiveIcon.foregroundImage field in app.json.

To update the application logo:

1. Replace the image files in the assets folder with your desired logo images. Ensure the images meet

   - icon.png or your chosen icon image: 512x512 pixels, PNG format.

   - adaptive-icon.png or your chosen adaptive icon image: transparent PNG, recommended size 108x

2. Update the app.json file to point to the new icon files if you use different filenames.

3. Rebuild the Android APK using EAS or Expo build commands to apply the changes.

Building the APK

To build the Android APK with the updated logo, run:

eas build -p android --profile production

This will upload your project to EAS Build and generate the APK with the configured application logo.

Additional Information

- The splash screen image is configured separately in app.json under the splash field.

- For more details on configuring app icons and splash screens, refer to the Expo documentation.
